Final Project Recap

This class has taught me a lot and is by far the most challenging course I have completed so far. I decided to create a recipe app that would allow users to add recipes while importing images of their creations. This would assist with having them all in one area and avoid the searching for a piece of paper you wrote it on.

I attempted to include a lot of the things we were taught. I installed capacitor for the image functionality of my app. In addition, I did include a recipe service to assist with implementing features throughout the application. I did run into errors when trying to get all the functionalities to work like the view details was the hardest for me. I did you use the generate pages to add the additional files for add-recipe and recipe-details. I decided for my styling to be quite simple with a tan background and teal buttons. It was not too overpowering or distracting.

In the future, I would love to make my application more interactive. I want the ingredients in the form of a checklist that would allow users to check off what they have already, then, they can see what would be needed. I want to incorporate MongoDB for scalability thinking down the future.

There is more potential to this application, and I truly look forward to continuing to make improvements and learn as I go.
